

Environmental, energy and climate policy

As part of our >>**corporate policy**<< we have been actively addressing environmental protection, energy efficiency and climate related issues for many years.

The following guidelines form the basis of our actions:

1. We consider environmental protection and the efficient use of energy to be an important part of our company management processes alongside other company goals. As part of our management system, we collect and evaluate our absolute and specific energy consumption and our environmental performance, and set targets that bring about continuous improvement.
We promote environmental knowledge and energy and environmental awareness among our employees through targeted training.
Appropriate resources are made available for the necessary investments.
2. We actively ensure that we comply with the legal principles and regulations that apply to the running of our company. We assign clear responsibilities when it comes to monitoring the compliance of technical and organisational procedures with the company's environmental, energy and climate related policy.
3. The reduction of noise and air emissions as well as the avoidance of water pollution are of high environmental relevance for us at the Eppstein site.
We regularly assess and/or monitor the impact of our activities on the local environment.
4. Efficient use of energy, raw materials and resources (recycling, waste avoidance and proper disposal) allows us to sustainably reduce our impact on the environment.

The environmental aspects, energy consumption and climate related aspects of each new activity, product and process are taken into account before they are introduced. Where environmental and climate related impact cannot be avoided, we reduce it.
5. Within the framework of the existing permits and conditions, we are in open dialogue with the relevant authorities about EppsteinFOILS's impact on the environment and about environmental measures.

Eppstein, January 2022

Managing Director/CEO
